# Three-Step Iterative Method with Fifth Order Convergence for Solving Non-linear Equations 

Rajesh Kumar Palli, Mani Sandeep Kumar Mylapalli* and Ramadevi Sri

#### Abstract

In this paper, a new three step iterative method is proposed based on the Newton's Method to obtain the numerical solution of non linear equation. We prove that our method take over fifth order convergence and the efficiency of the recommended method is shown by the numerical examples comparing with existing Method.

Keywords--- Iterative Method, Nonlinear Equation, Newton's Method, Convergence Analysis.

## I. Introduction

To solve transcendental equation we have so many methods in the literature of numerical analysis. These days much attention has given to develop different iterative methods to find the root of non-linear equation. One of the well known, very important methods to find the root of non linear equation is Newton's method

$$
\begin{equation*}
f(x)=0 \tag{1.1}
\end{equation*}
$$

where f is a scalar function on open interval D is a classical Newton's method (NR) given by

$$
\begin{align*}
x_{n+1}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}  \tag{1.2}\\
n=0,1,2, \ldots
\end{align*}
$$

This quadratically convergent method and its efficiency index is $\sqrt{2}=1.414$.
An efficient Newton type method with fifth order of convergence for solving nonlinear equations (FANG) proposed by Liang Fang [3] is given by

$$
\left.\begin{array}{l}
y_{n}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}  \tag{1.3}\\
x_{n+1}=y_{n}-\frac{5 f^{\prime 2}\left(x_{n}\right)+3 f^{\prime 2}\left(y_{n}\right)}{f^{\prime 2}\left(x_{n}\right)+7 f^{\prime 2}\left(y_{n}\right)} \cdot \frac{f\left(y_{n}\right)}{f^{\prime}\left(x_{n}\right)}
\end{array}\right\}
$$

A New third order iterative method for solving non linear equations $(\mathrm{CH})$ proposed by C . Chun [1] is given by

$$
\left.\begin{array}{l}
z_{n}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}  \tag{1.4}\\
x_{n+1}=x_{n}-\frac{1}{2}\left(3-\frac{f^{\prime}\left(z_{n}\right)}{f^{\prime}\left(x_{n}\right)}\right) \frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}
\end{array}\right\}
$$

A Composite third order Newton- Steffensen's method for solving nonlinear equations (SM) proposed by J. R. Sharma [2] is given by

Rajesh Kumar Palli, Research Scholar, Department of Mathematics GITAM (Deemed to be University), Visakhapatnam, India.
Mani Sandeep Kumar Mylapalli*, Department of Mathematics GITAM (Deemed to be University, Visakhapatnam, India. E-mail: manisandeepkumar.mylapalli@gitam.edu

Ramadevi Sri, Department of Mathematics, Dr. L. Bullayya College, Visakhapatnam, India. E-mail: ramadevisri9090@gmail.com

$$
\left.\begin{array}{l}
y_{n}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}  \tag{1.5}\\
x_{n+1}=x_{n}-\frac{\left(f\left(x_{n}\right)\right)^{2}}{f^{\prime}\left(x_{n}\right)\left(f\left(x_{n}\right)-f\left(y_{n}\right)\right)}
\end{array}\right\}
$$

An iterative method for solving nonlinear equations (ZANG) proposed by Zhonyong [7] is given by

$$
\left.\begin{array}{l}
y_{n}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)} \\
x_{n+1}=y_{n}-\left(1+\left(\frac{f\left(y_{n}\right)}{f\left(x_{n}\right)}\right)^{2}\right) \frac{f\left(y_{n}\right)}{f^{\prime}\left(y_{n}\right)} \tag{1.6}
\end{array}\right\}
$$

In this paper we define a new three step iterative method which raises the convergence and increases the efficiency of a function and establish the convergence of this approach. In the next section different numerical tests confirm the theoretical results and allow us to compare these variants with classical methods.

## II. Fifth Order Convergent Method

A fifth order iterative method to solving nonlinear equations proposed by Mafiullah[5] given by

$$
\begin{align*}
x_{n+1}=z_{n}- & \frac{\left[f\left(y_{n}\right)\right]^{2} f^{\prime \prime}\left(y_{n}\right)}{2\left[f^{\prime}\left(x_{n}\right)\right]^{2} f^{\prime}\left(y_{n}\right)}  \tag{2.1}\\
& \text { where } z_{n}=y_{n}-\frac{f\left(y_{n}\right)}{f^{\prime}\left(y_{n}\right)} \text { and } y_{n}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)} .
\end{align*}
$$

The order of convergence of this method is 5 and the efficiency index is 3.18.
Replacing $z_{n}$ by $y_{n}$ and $y_{n}$ by $x_{n}$ in "(2.1)", we obtain

$$
\begin{array}{r}
x_{n+1}=y_{n}-\mu \frac{f\left(x_{n}\right) f^{\prime}\left(x_{n}\right)}{2\left[f^{\prime}\left(x_{n}\right)\right]^{2}}  \tag{2.2}\\
\quad \text { where } \mu=\frac{f\left(x_{n}\right) f^{\prime \prime}\left(x_{n}\right)}{\left[f^{\prime}\left(x_{n}\right)\right]^{2}}
\end{array}
$$

## Algorithm

For a given $x_{0}$ we compute $x_{n+1}$ by the iterative scheme

$$
\begin{align*}
& y_{n}=x_{n}-\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)} \\
& z_{n}=y_{n}+\left(f^{\prime}\left(y_{n}\right)-f^{\prime}\left(x_{n}\right)\right)\left(\frac{f\left(x_{n}\right)}{2\left(f^{\prime}\left(x_{n}\right)^{2}\right)}\right)  \tag{2.5}\\
& x_{n+1}=z_{n}-\frac{f\left(z_{n}\right)}{f^{\prime}\left(y_{n}\right)}
\end{align*}
$$

The method "(2.5)" is called as fifth order convergent method (MMS), requires 2 functional evaluations and 2 of its first derivatives.

## III. Convergence Criteria

Thoerem: Let $x_{0} \in D$ be a single zero of a sufficiently differentiable function $f$ for an open interval $D$. If $x_{0}$ is in the neighborhood of $x^{*}$. Then "(2.5)" has fifth order convergence.

Proof: Let $x^{*}$ be a single zero of "(1.1)" and

$$
x^{*}=x_{n}+\varepsilon_{n}
$$

then $f\left(x^{*}\right)=0$. Expanding $f\left(x^{*}\right)$ by Taylor's series about $x_{n}$, we have

$$
\begin{align*}
& f\left(x_{n}\right)=f^{\prime}\left(x^{*}\right)\left(\varepsilon_{n}+c_{2} \varepsilon_{n}^{2}+c_{3} \varepsilon_{n}^{3}+c_{4} \varepsilon_{n}^{4}+\ldots\right)  \tag{3.1}\\
& f^{\prime}\left(x_{n}\right)=f^{\prime}\left(x^{*}\right)\left(1+2 c_{2} \varepsilon_{n}+c_{3} \varepsilon_{n}^{2}+4 c_{4} \varepsilon_{n}^{3}+\ldots\right) \tag{3.2}
\end{align*}
$$

Dividing "(3.1)" by "(3.2)",
we have

$$
\begin{equation*}
\frac{f\left(x_{n}\right)}{f^{\prime}\left(x_{n}\right)}=\binom{\varepsilon_{n}-c_{2} \varepsilon_{n}^{2}-\left(2 c_{3}-2 c_{2}^{2}\right) \varepsilon_{n}^{3}-}{\left(3 c_{4}-7 c_{2} c_{3}+4 c_{2}^{3}\right) \varepsilon_{n}^{4}+\ldots} \tag{3.3}
\end{equation*}
$$

From the first step of MMS, we obtain

$$
y_{n}=x^{*}+\alpha_{n}
$$

where

$$
\alpha_{n}=c_{2} \varepsilon_{n}^{2}+\left(2 c_{3}-2 c_{2}^{2}\right) \varepsilon_{n}^{3}+\left(3 c_{4}-7 c_{2} c_{3}+4 c_{2}^{3}\right) \varepsilon_{n}^{4}+\ldots
$$

Now,

$$
f^{\prime}\left(y_{n}\right)=f^{\prime}\left(x^{*}\right)\left(1+2 c_{2}^{2} \varepsilon_{n}^{2}+\left(4 c_{2} c_{3}-4 c_{2}^{3}\right) \varepsilon_{n}^{3}+\ldots\right)
$$

Then, we have $f^{\prime}\left(y_{n}\right)-f^{\prime}\left(x_{n}\right)=f^{\prime}\left(x^{*}\right)\left(-2 c_{2} \varepsilon_{n}+\left(2 c_{2}^{2}-3 c_{3}\right) \varepsilon_{n}{ }^{2}+\right.$

$$
\left(4 c_{2} c_{3}-4 c_{2}^{3}-4 c_{4}\right) \varepsilon_{n}^{3}+\left(6 c_{2} c_{4}-14 c_{2}^{2} c_{3}+8 c_{2}^{4}+3 c_{2}^{2} c_{3}\right) \varepsilon_{n}^{4}+. . \text { and }
$$

$$
\left(f^{\prime}\left(y_{n}\right)-f^{\prime}\left(x_{n}\right)\right)\left[\frac{f\left(x_{n}\right)}{2\left(f^{\prime}\left(x_{n}\right)^{2}\right)}\right]=c_{2} \varepsilon_{n}^{2}+\left(8 c_{2}^{2}-\frac{3}{2} c_{3}\right) \varepsilon_{n}^{3}
$$

$$
\begin{equation*}
+\left(-57 c_{2}^{3}+\frac{47}{2} c_{2} c_{3}-2 c_{4}\right) \varepsilon_{n}^{3}+\ldots \tag{3.4}
\end{equation*}
$$

From the second step of "(2.5)", we get

$$
z_{n}=x^{*}+\rho
$$

$$
\text { Where } \rho=\left(6 c_{2}^{2}-\frac{1}{2} c_{3}\right) \varepsilon_{n}^{3}+\left(-53 c_{2}^{3}+\frac{33}{2} c_{2} c_{3}+c_{4}\right) \varepsilon_{n}^{4}+\ldots
$$

Now

$$
\begin{equation*}
\frac{f\left(z_{n}\right)}{f^{\prime}\left(y_{n}\right)}=\left(6 c_{2}^{2}-\frac{1}{2} c_{3}\right) \varepsilon_{n}^{3}+\left(-53 c_{2}^{3}+\frac{33}{2} c_{2} c_{3}+c_{4}\right) \varepsilon_{n}^{4}+\frac{1}{2}\left(64 c_{2} c_{4}-16 c_{2}^{4}-405 c_{2}^{2} c_{3}\right) \varepsilon_{n}^{5}+\ldots \tag{3.5}
\end{equation*}
$$

Finally, by the third step of "(2.5)", we have

$$
x_{n+1}=x^{*}+\frac{1}{2}\left(64 c_{2} c_{4}-16 c_{2}^{4}-405 c_{2}^{2} c_{3}\right) \varepsilon_{n}^{5}+\ldots
$$

Hence this method is fifth order convergence and its efficiency index is $\sqrt[4]{5}=1.4953$

## IV. Numerical Examples

After consider the some examples considered by Jayakumar [6] and Noor [4] compared our method (MMS) with NR, FANG, CH, SM and ZANG methods. The computations are carried out by using mpmath-PYTHON software programming and comparison of number of iterations for these methods are obtained such that $\left|x_{n+1}-x_{n}\right|<10^{-201}$ and $\left|f\left(x_{n+1}\right)\right|<10^{-201}$.

The test functions and simple zeros are given below $f_{1}(x)=\sin (2 \cos x)-1-x^{2}+e^{\sin \left(x^{3}\right)}$, $x^{*}=-0.78489$

$$
\begin{gathered}
f_{2}(x)=x e^{\left(x^{2}\right)}-\sin ^{2} x+3 \cos x+5, x^{*}=-1.20764 \\
f_{3}(x)=\sin x+\cos x+x, x^{*}=-0.4566
\end{gathered}
$$

$$
\begin{gathered}
f_{4}(x)=(x+2) e^{x}-1, x^{*}=-0.44285 \\
f_{5}(x)=x^{2}+\sin \left(\frac{x}{5}\right)-\frac{1}{4}, x^{*}=0.40999
\end{gathered}
$$

Table IV (a): Comparison of Efficiency Index

| Methods | P | N | EI |
| :---: | :---: | :---: | :---: |
| NR | 2 | 2 | 1.414 |
| CH | 6 | 4 | 1.442 |
| SM | 3 | 3 | 1.442 |
| FANG | 5 | 4 | 1.495 |
| ZANG | 5 | 4 | 1.495 |
| MMS | 5 | 4 | 1.495 |

where P is order of the convergence, N is the number of functional values per iteration and EI is the Efficiency Index.

\hline
\end{tabular}

Where $x_{0}$ is the initial approximation, $n$ is the number of iterations, er is the error and $f v$ is the functional value.

## V. CONClUSION

Then, we In this method we developed new fifth order convergent method with efficiency index 1.495. It requires two functional evaluations and two of its first derivatives. Table IV(a) compares the efficiency of different methods and the computational results in table $\operatorname{IV}(\mathrm{b})$ exhibit the superiority of the new method over the NR, FANG, CH, NK, SM and ZANG, FOCM methods in terms of number of iterations and accuracy.
